D1 Summary

Guatemala, 26 de julio de 2026
María Alejandra Cifuentes Vargas
14009139

1. Venture One-Liner

This project is a subscription-based multi-bakery platform that enables small bakeries to create their own branded online storefront, display products and prices, and receive customer order requests through a simple online ordering experience. Morena serves as the pilot bakery to validate the platform before onboarding additional bakery tenants.

2. Problem and Solution

Many small bakeries still manage customer orders manually through WhatsApp or social media, making it difficult to organize product information, pricing and customer requests efficiently. The proposed solution is a subscription-based digital platform where each bakery can manage its own catalogue, pricing and branding independently while customers can browse products and submit online order requests. The platform isolates each bakery's products, branding and customer orders through a tenant-based architecture, allowing multiple businesses to operate independently within the same system.

3. Key PRD Decisions

The Product Requirements Document (PRD) establishes the project as a subscription-based platform designed for multiple bakeries rather than a solution for a single business. Morena was repositioned as the pilot bakery to validate the concept before onboarding additional bakery tenants. The PRD also establishes tenant isolation so that each bakery manages only its own catalogue, branding and customer orders. The MVP focuses on three core features: browsing a product catalogue, viewing product prices and submitting an online order request. The PRD also defines the target users, user stories, project scope, success criteria and the features intentionally excluded from the initial version to keep the MVP focused and achievable.

4. Key FRD Decisions

The Functional Requirements Document (FRD) specifies how the three core features work from the user's perspective. The document describes each screen individually, including the product catalogue, product details and pricing, online order form and confirmation screen. For each screen, the FRD defines what the user sees, what the user does, the required inputs, expected outputs and relevant edge cases. This level of detail provides a clear functional specification that supports AI-assisted development.

5. AI Iteration Process

- **AI Critique:** The target users were described too broadly and did not provide enough context about how bakery owners currently manage customer orders. Without understanding their current workflow, it was difficult to justify the product requirements and the value of the MVP.
- **Change Made:** The Target Users section was expanded to explain that bakery owners currently receive orders manually through WhatsApp, Instagram and other social media channels, making it difficult to organise products, prices and customer requests. The customer profile was also expanded to explain how buyers browse products, check prices and submit order requests, making the requirements more specific and easier to implement.

6. Conclusion

The D1 specification establishes a solid foundation for the remaining stages of the project. By clearly defining the problem, the solution, the functional requirements and the project scope, the documentation provides a consistent guide for future AI-assisted development. The resulting specification supports the creation of a scalable multi-bakery platform while ensuring the initial MVP remains focused, realistic and ready for AI-assisted implementation.
