D1 Summary

1. Venture One-Liner

This project is a subscription-based multi-bakery platform that enables small bakeries to create their own branded online storefront, display products and prices, and receive customer order requests through a simple digital experience. Morena serves as the pilot bakery to validate the platform before onboarding additional bakery tenants.

2. Problem and Solution

Many small bakeries still manage customer orders manually through WhatsApp or social media, making it difficult to organize product information, pricing and customer requests efficiently. The proposed solution is a subscription-based digital platform where each bakery can manage its own catalogue, pricing and branding independently while customers can browse products and submit online order requests. The platform separates the information of each bakery through a tenant-based architecture, allowing multiple businesses to operate within the same system.

3. Key PRD Decisions

The Product Requirements Document (PRD) defines the project as a subscription-based platform designed for multiple bakeries instead of a solution for a single business. Morena was repositioned as the pilot bakery to validate the platform before supporting additional bakery tenants. The MVP focuses on three core features: browsing a product catalogue, viewing product prices and submitting an online order request. The PRD also defines the target users, user stories, project scope, success criteria and the features intentionally excluded from the initial version to keep the MVP focused and achievable.

4. Key FRD Decisions

The Functional Requirements Document (FRD) specifies how the three core features work from the user's perspective. The document describes each screen individually, including the product catalogue, product details and pricing, online order form and confirmation screen. For each screen, the FRD defines what the user sees, what the user does, the required inputs, expected outputs and relevant edge cases. This level of detail provides clear guidance for future development using AI-assisted tools.

5. AI Iteration Process

The project evolved through multiple iterations using AI assistance and instructor feedback. Initially, the venture focused on a single bakery (Morena). After reviewing the initial requirements, the project was redefined as a subscription-based multi-bakery platform capable of supporting multiple independent bakery tenants. The PRD, FRD and sample data were updated accordingly, including the addition of a bakery field in the product data to separate information between tenants. This iterative process resulted in a clearer, more scalable solution while maintaining Morena as the pilot bakery.

6. Conclusion

The D1 specification establishes a solid foundation for the remaining stages of the project. By clearly defining the problem, the solution, the functional requirements and the project scope, the documentation provides a consistent guide for future AI-assisted development. The resulting specification supports the creation of a scalable multi-bakery platform while keeping the initial MVP focused and achievable.
