1. Live Prototype

<https://malecifuentes.github.io/morena/>

2. What the Prototype Does Today

The current Morena Bakery prototype allows customers to browse a product catalogue, view product prices and availability, open a product details screen, select a quantity, and navigate back to the catalogue. Morena is currently used as the pilot bakery for the multi-bakery subscription platform.

3. What Is Currently Wired

The Product Catalogue and Product Details and Pricing screens are currently connected. Customers can select “View details” from the catalogue to open the selected product and can return to the catalogue from the details screen. Product information is displayed from the sample data included in the repository.

4. What Is Not Yet Wired

The Online Order Request Form and Order Request Confirmation are not yet connected in the current prototype. They remain part of the planned MVP and will be implemented in a later iteration.

5. AI-Assisted Build and Review

I directed Cline to build the Morena Bakery prototype using the existing PRD, FRD, brand brief and sample product data in the repository. The instructions specified plain HTML, CSS and JavaScript without a framework or build step.

During the build, Cline was used to define the navigation flow and begin the Product Details and Pricing screen. When Cline encountered repeated tool-call failures and a 429 rate-limit error, I documented the issue and continued the implementation using Codex while keeping the same project requirements and brand brief.

After reviewing the working prototype, I verified that the catalogue opened the correct product details, that the displayed price and availability matched the product data, that quantity selection was available, and that navigation back to the catalogue worked. I then refined docs/FRD.md so the specification matched the functionality currently implemented in the repository.
